# COMPLETE PACKAGING LINE PROCESS

## 1. Emptying and treatment.

It can be done by conveyor belt if it is dry, or in a treatment pond if it is in water.

## 2. Feed conveyor belt.

## 3. Associative linear weigher.

Weighing solution with choice of 12 or 14 heads. The weight error can be +/- 1 gr. It has a production capacity of 45 to 65 packs per minute depending on the machinery's prototype. The entire surface on which the cherry impacts, or the delicate fruit, is perfectly padded by a "shock absorber" surface, with minimal drop in height to ensure the product's quality.

## 4. Synchronized conveyor belt.

Conveyor that synchronizes the weigher with the automatic bagger.

## 5. Synchronized canva conveyor belt.

It allows packaging different models of tubs and boxes with a quick change of format. It admits options such as the tub dispenser or the hinged tub seamer.

## 6. Bagger.

The FB30 solution has been conceived to bag product. This point of the journey, integrates the bag picking vacuum system, the bag loader and a zipper closure system that ensures the quality of the container until it is consumed. Optional thermosealing or open bags.
